

I. Codebase with Git

Relevant Documentation

- [Twelve-Factor App: I. Codebase](#)
- [Git](#)
- [Sample Project](#)

Lesson Reference

Note: You will need a *free* [GitHub](#) account to follow along with this lesson. If you do not have an account, go ahead and create one.

In a browser, navigate to the sample app GitHub repository:

<https://github.com/ACloudGuru/content-designing-applications-for-kubernetes>

Log in to GitHub if you have not already done so.

Use the **Fork** button to create your own, separate copy of the sample app repository.

Feel free to explore the sample app source code!

Click the **Code** button. Select **HTTPS**, and copy the repository clone URL.

Log in to your build server where you installed Docker (in the video, we used the Kubernetes control plane server for this).

Clone the GitHub repository:

```
git clone <REPOSITORY_CLONE_URL>
```
